This is particularly evident for group B adenoviruses (such as AdHu35) and certain nonhuman adenoviruses shown poorer recovery yields when propagated in 293 cells. 25 This, however, can be overcome by two methods: (i) transcomplementing the E1 protein specific to the adenovirus through transfecting the cell line with an additional vector expressing the adenovirus-unique E1 protein, and (ii) using a different cell line.

Moreover to enhancing the cancer-specific viral replication and killing, conditionally replicative adenoviruses (CRAds) have been developed. There are two main types of CRAds: mutation-based and cancer-specific promoter-based [1,2]. The first type of CRAds utilizes mutations or deletions in the E1 region of the adenoviral genome, which allows replication only in specific tumors which can compensate the loss of function due to mutation.
