The basic approximation in open channel hydraulics, which is usually a very good one, is that variation along the channel is gradual. One of the most important consequences of this is that the pressure in the water is given by the hydrostatic approximation, that it is proportional to the depth of water above.

In open-channel flow the driving force (that is the force causing the motion) is the component of gravity along the channel bottom. Therefore, it is clear that, the effect of gravity is very important in open-channel flow.

The head loss for unit length of channel length is energy line (hydraulic) slope, $S_{in} = \frac{L_z}{L} = \frac{h}{S} = \frac{L}{h}$ Since in open channel flows the channel slope is generally a small value, $S_{in} \approx \tan \theta$ $\tan \theta \approx \frac{S}{100} = S_0 \times h$ $\tan \theta = L$ (channel bottom slope) $S_{ener} = S_0$ (4.9) Conclusion: Hydraulic grade line coincides with water surface slope in every kind of
