~~Zeolite beta is an intergrowth of two or three polymorphs, including chiral polymorph-A, achiral polymorph-B, and polymorph-C. Chiral polymorph-A of zeolite beta is highly desired because of its potential applications in enantioseparation and asymmetric catalysis. However, it is still impossible to obtain the pure polymorph-A of zeolite beta.~~

The Charge Density Mismatch approach to zeolite synthesis has been applied to the Li-Sr-choline aluminosilicate system yielding the related structures UZM-4 (BPH) and UZM-22 (MEI). The elements of synthesis necessary to achieve template cooperation were demonstrated within the approach, including how to handle very strong structure directing agents such as Li and Sr that are not normally used in that role.
